# **NumPy - Advanced Indexing**

#### From last time: subsetting with tuples

Unlike lists, an indarray can be subset by a tuple containing integers,

```
x = np.arange(6)
                                                       x = np.arange(16).reshape((4,4))
## array([0, 1, 2, 3, 4, 5])
                                                      ## array([[ 0, 1, 2, 3],
                                                                [4, 5, 6, 7],
                                                                [8, 9, 10, 11],
x[(0,1,3),]
                                                                [12, 13, 14, 15]])
                                                      ##
## array([0, 1, 3])
                                                       x[(0,1,3), :]
x[(0,1,3)]
                                                      ## array([[ 0, 1, 2, 3],
                                                                [4, 5, 6, 7],
## Error in py_call_impl(callable, dots$args, dots
                                                                [12, 13, 14, 15]])
                                                      ##
##
## Detailed traceback:
                                                       x[:, (0,1,3)]
    File "<string>", line 1, in <module>
x[0,1,3]
                                                      ## array([[ 0, 1, 3],
                                                                [4, 5, 7],
                                                               [8, 9, 11],
## Error in py_call_impl(callable, dots$args, dots
More next time on why x[(0,1,3)] does not work.
                                                      ##
                                                                [12, 13, 15]])
## Detailed traceback:
```

#### Integer array subsetting (lists)

Lists of integers can be used to subset in the same way:

```
x = np.arange(6)
## array([0, 1, 2, 3, 4, 5])
x[[0,1,3],]
## array([0, 1, 3])
x[[0,1,3]]
## array([0, 1, 3])
x[[1.,3.]]
## Error in pv_call_impl(callable, dots$args, dots$keywords): In
##
## Detailed traceback:
    File "<string>", line 1, in <module>
```

```
x = np.arange(16).reshape((4,4))
## array([[ 0, 1, 2, 3],
         [4, 5, 6, 7],
       Γ 8. 9. 10. 117.
         [12, 13, 14, 15]])
x[[1,3]]
## array([[ 4, 5, 6, 7],
        [12, 13, 14, 15]])
x[[1,3],]
## array([[ 4, 5, 6, 7],
        [12, 13, 14, 15]])
x[:, [1,3]]
## array([[ 1, 3],
        [5, 7],
        [ 9, 11],
         [13, 15]])
x[[1,3], [1,3]]
```

#### Integer array subsetting (ndarrays)

Similarly we can also us integer ndarrays:

```
x = np.arange(6)
v = np.arrav([0,1,3])
 z = np.array([1., 3.])
x[y,]
## array([0, 1, 3])
хГуЛ
## array([0, 1, 3])
x[z]
## Error in py_call_impl(callable, dots$args, dots$keywords): In
##
## Detailed traceback:
    File "<string>", line 1, in <module>
```

```
x = np.arange(16).reshape((4,4))
## array([[ 0, 1, 2, 3],
        Γ 4, 5, 6, 7],
    Г 8. 9. 10. 117.
        Γ12, 13, 14, 15]])
y = np.array([1,3])
x[y]
## array([[ 4, 5, 6, 7],
        [12, 13, 14, 15]])
x[y,]
## array([[ 4, 5, 6, 7],
        [12, 13, 14, 15]])
x[:, y]
## array([[ 1, 3],
        [5, 7],
       [ 9, 11],
        [13, 15]])
```

#### **Exercise 1**

##

Given the following matrix,

[12, 13, 14, 15]])

```
x = np.arange(16).reshape((4,4))
x

## array([[ 0,  1,  2,  3],
##        [ 4,  5,  6,  7],
##        [ 8,  9,  10,  11],
```

write an expression to obtaint the center 2x2 values (i.e. 5, 6, 9, 10 as a matrix).

## **Boolean indexing**

Lists or ndarrays of boolean values can also be used to subset, positions with True are kept and False are discarded.

```
x = np.arange(6)
x

## array([0, 1, 2, 3, 4, 5])
x[[True, False, True, False, True, False]]

## array([0, 2, 4])
x[np.array([True, True, False, False, True, False])]
## array([0, 1, 4])
```

the utility comes from vectorized comparison operations,

```
x > 3
## array([False, False, False, False, True, True])
x[x>3]
## array([4, 5])
x % 2 == 1
```

#### NumPy and Boolean operators

y | (x > 3)

If we want to use a boolean operator on an array we need to use &, I, and ~ instead of and, or, and not respectively.

```
x = np.arange(6)
## array([0, 1, 2, 3, 4, 5])
y = x \% 2 == 0
## array([ True, False, True, False, True, False])
 ~y
## array([False, True, False, True, False, True])
v & (x > 3)
## array([False, False, False, False, True, False])
```

#### meshgrid

One other useful function in NumPy is meshgrid() which generates all possible combinations between the input vectors,

```
pts = np.arange(3)
x, y = np.meshgrid(pts, pts)
## array([[0, 1, 2],
   [0, 1, 2],
  [0, 1, 2]])
У
## array([[0, 0, 0],
  [1, 1, 1],
  [2, 2, 2]])
np.sqrt(x**2 + y**2)
## array([[0. , 1. , 2. ],
        [1. , 1.41421356, 2.23606798],
        [2. , 2.23606798, 2.82842712]])
```

#### **Exercise 2**

We will now use this to attempt a simple brute force approach to numerical optimization, define a grid of points using meshgrid() to approximate the minima the following function:

$$f(x, y) = (1 - x)^2 + 100(y - x^2)^2$$

Considering values of  $x, y \in (-1, 3)$ , which values of x, y minimize this function?

# **NumPy - Broadcasting**

## **Broadcasting**

## array([2, 4, 6])

This is an approach for deciding how to generalize arithmetic operations between arrays with differing shapes.

```
x = np.array([1, 2, 3])
x * 2

## array([2, 4, 6])

x * np.array([2])

## array([2, 4, 6])

x * np.array([2, 2, 2])
```

In the first example 2 is equivalent to the array np.array([2]) which is being broadcast across the longer array x.

#### **Efficiancy**

Using broadcasts can be much more efficient as it does not copy the underlying data,

```
x = np.arange(1e5)
y = np.array([2]).repeat(1e5)

%timeit x * 2

31.3 μs ± 1.3 μs per loop (mean ± std. dev. of 7 runs, 10,000 loops each)

%timeit x * y

70.5 μs ± 2.93 μs per loop (mean ± std. dev. of 7 runs, 10,000 loops each)
```

#### **General Broadcasting**

When operating on two arrays, NumPy compares their shapes element-wise. It starts with the trailing (i.e. rightmost) dimensions and works its way left. Two dimensions are compatible when

- 1. they are equal, or
- 2. one of them is 1

If these conditions are not met, a ValueError: operands could not be broadcast together exception is thrown, indicating that the arrays have incompatible shapes. The size of the resulting array is the size that is not 1 along each axis of the inputs.

#### A quick fix

```
x = np.arange(12).reshape((3,4))
Х
## array([[ 0, 1, 2, 3],
## [4, 5, 6, 7],
## [8, 9, 10, 11]])
x + np.array([1,2,3])
## Error in py_call_impl(callable, dots$args, dots$keywords): ValueError: operands could not be broadcast toget
##
## Detailed traceback:
   File "<string>", line 1, in <module>
x + np.array([1,2,3]).reshape(3,1)
## array([[ 1, 2, 3, 4],
## [6, 7, 8, 9],
##
   [11, 12, 13, 14]])
```

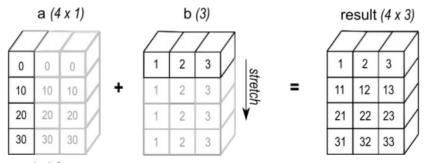

#### **Mechanics**

```
x = np.arange(12).reshape((4,3))
v = 1
\chi + \gamma
                                                      \chi + \gamma
## array([[ 1, 2, 3],
   [4, 5, 6],
                                                     ##
## [7, 8, 9],
## [10, 11, 12]])
   (2d array): 4 x 3
   (1d array): 1
x+y (2d array): 4 x 3
x = np.arange(12).reshape((4,3))
y = np.array([1,2,3])
\chi + \gamma
                                                      \chi + \gamma
## array([[ 1, 3, 5],
## [4, 6, 8],
## [ 7, 9, 11],
##
   [10, 12, 14]])
```

```
x = np.arange(12).reshape((3,4))
y = np.array([1,2,3])
## Error in py_call_impl(callable, dots$args, dots$keyw
## Detailed traceback:
## File "<string>", line 1, in <module>
x (2d array): 3 x 4
y (1d array): 3
x+y (2d array): Error
x = np.arange(12).reshape((3,4))
y = np.array([1,2,3]).reshape((3,1))
## array([[ 1, 2, 3, 4],
## [ 6, 7, 8, 9],
## [11, 12, 13, 14]])
```

#### **Another example**

## array([1, 2, 3])

## **Example - Standardizing**

Below we generate a data set with 3 columns of random normal values. Each column has a different mean and standard deviation which we can check with mean() and std().

```
rng = np.random.default_rng(1234)

d = rng.normal(loc=[-1,0,1], scale=[1,2,3], size=(1000,3))
d.mean(axis=0)

## array([-1.0294382 , -0.01396257, 1.01241784])

d.std(axis=0)

## array([0.99674719, 2.03222595, 3.10625219])
```

Use broadcasting to standardize all three columns to have mean 0 and standard deviation 1. Check the new data set using mean() and std().

#### **Exercise 3**

For each of the following combinations determine what the resulting dimension will be:

- A (128 x 128 x 3) + B (3)
- A (8 x 1 x 6 x 1) + B (7 x 1 x 5)
- A (2 x 1) + B (8 x 4 x 3)
- $A(3 \times 1) + B(15 \times 3 \times 5)$
- A (3) + B (4)

#### **Broadcasting and assignment**

In addition to arithmetic operators, broadcasting can be used with assignment via array indexing,

```
x = np.arange(12).reshape((3,4))
v = -np.arange(4)
z = -np.arange(3)
x[:] = v
                                                    x[:] = z
                                                   ## Error in py_call_impl(callable, dots$args, dots$keyw
## array([[ 0, -1, -2, -3],
                                                   ##
## [ 0, -1, -2, -3],
                                                   ## Detailed traceback:
## [0, -1, -2, -3]
                                                      File "<string>", line 1, in <module>
x[\ldots] = y
                                                    x[:] = z.reshape((3,1))
## array([[ 0, -1, -2, -3],
                                                   ## array([[ 0, 0, 0, 0],
## [ 0, -1, -2, -3],
                                                   ## [-1, -1, -1],
## \Gamma 0. -1. -2. -3]])
                                                   ## [-2, -2, -2, -2]
```

# NumPy - Basic file IO

## **Reading and writing arrays**

We will not spend much time on this as most data you will encounter is more likely to be a tabular format (e.g. data frame) and tools like Pandas are more appropriate.

For basic saving and loading of NumPy arrays there are the <code>save()</code> and <code>load()</code> functions which use a built in binary format.

```
x = np.arange(1e5)
np.save("data/x.npy", x)
new_x = np.load("data/x.npy")
np.all(x == new_x)
```

## True

Additional functions for saving (savez(), savez\_compressed(), savetxt()) exist for saving multiple arrays or saving a text representation of an array.

#### Reading delimited data

While not particularly recommended, if you need to read delimited (csv, tsv, etc.) data into a NumPy array you can use <code>genfromtxt()</code>,

```
options(width=300)
with open("data/mtcars.csv") as file:
    mtcars = np.genfromtxt(file, delimiter=",", skip_header=True)
mtcars
## array([[ 6.
              , 160.
                     , 110. , 3.9 , 2.62 , 16.46 , 0. ,
              , 160.
                     , 110. , 3.9 , 2.875, 17.02 , 0. , 1. ,
              , 108.
                    , 93. , 3.85 , 2.32 , 18.61 , 1. , 1. ,
              . 258.
                    , 110. , 3.08 ,
                                     3.215, 19.44 , 1. , 0. ,
              , 360. , 175. , 3.15 , 3.44 , 17.02 , 0. , 0. ,
              , 225. , 105.
                            , 2.76 , 3.46 , 20.22 ,
              , 360.
                     , 245.
                          , 3.21 , 3.57 ,
                                             15.84 ,
              , 146.7 , 62. , 3.69 ,
                                     3.19 ,
                                             20. ,
              , 140.8
                    , 95. , 3.92 ,
                                     3.15 , 22.9 ,
              , 167.6
                     , 123.
                           , 3.92 , 3.44 ,
                                             18.3 ,
              , 167.6
                                             18.9 , 1. ,
                                                            0. ,
                     , 123. , 3.92 , 3.44 ,
              . 275.8
                    , 180. , 3.07 , 4.07 , 17.4 , 0. , 0. ,
                                       3.73 , 17.6 , 0.
              , 275.8 , 180.
                                3.07 ,
```
